183

The ballonet is a smaller vessel shaped along the general pattern of the balloon proper, and its function is to keep the pressure constant and to maintain the shape. The pressure is supplied by a blower and controlled by a sensitive pressure valve.

A number of fatal accidents have resulted from the use of ballonets, and the design of a passenger ship should eliminate all possible hazards, therefore, there was no ballonet. To keep the required shape, I constructed a rectangular frame of spruce and ash which was 110 feet in length. The balloon was fastened to the frame by steel cables attached to 3/4" wooden toggles which in turn were attached to a heavy suspension band 120 feet in length on each side of the balloon and at a point below the center of the circumfrence where the cables would leave the surface.

These cables were spliced and soldered, and where there was a tendency to wear, pulleys were added.

The tenency of the frame or car to sway back and forward was taken care of by a series of cables which prevented such movements.

The tensile strength of the balloon fabric was determined to be 90 pounds per running inch. This produced a supporting strength of about 250,000 pounds.

A total of [[strikethrough]] 6 [[/strikethrough]] 76,000 cubic feet of hydrogen is contained in the balloon, and figuring the boyance or lift to be 65 pounds per 1,000 cu. ft. we had a gross lift of 5,000 pounds.

The belianet is a smaller reseal snaped along the paneral pattern of the balloon proper, and its function is to keep the pressure constent and to maintain the shape. The pressure is supplied by a blower and controlled by a sensetive pressure valve.

A number of fatal scridents have resulted from the use of balonets, and the design of a passenger ship should eliminate all possible banards, therefore, there are no maintain ballonet. To keep the required snape, I constructed a rectangular frame of spruce and ash which was 110 feet in length. The balloon was fastened to the frame by steel cables attached to 2° wooden toggles which in turn were attached to a heavy suspension band 120 feet in length on each side of the uniform and at a point mannabelow the center of the circumframe where the cables would heave the surface.

These cables were splitted and soldered, and where there was a tendence to wear, pulleys was added.

The tememory of the frees or car to sway back and forward was taken care of by a sories of cables which premented moch movements.

The tensile strength of the belloom fabric was detersined to be 90 pounds per running imph. This produced a supporting strength of about 250,000 pounds.

A total of Te,000 cubic feet of hydrogen is contained in the balloon, and figuring the boyonse or lift to be 65 pounds per 1,000 cu. ft. we had a gross lift of 5,000 pounds.

The mission of the Smithsonian is the increase and diffusion of knowledge - shaping the future by preserving our heritage, discovering new knowledge, and sharing our resources with the world. Founded in 1846, the Smithsonian is the world's largest museum and research complex, consisting of 19 museums and galleries, the National Zoological Park, and nine research facilities. Become an active part of our mission through the Transcription Center. Together, we are discovering secrets hidden deep inside our collections that illuminate our history and our world.
