## Global Information System Test

For NASA, 1992 will be a critical period in the development of the Earth Observing System to be launched aboard the polar platforms later in the 1990's as the centerpiece of an evolving international Earth system observing program. The TOPEX/Poseidon and Upper Atmosphere Research Satellite (UARS) should be ready for launch as a major contribution to the study of ocean dynamics and the ozone layer. The European Space Agency Earth Resources Satellite (ERS-1) and possibly the Japanese JERS-1 should be beginning to make major contributions to the study of the earth, in addition to the meteorological, land and ocean systems in various countries which are already in place and expected to continue.

The benefits of that already planned activity in space would be greatly enhanced if the International Space Year were dedicated to the Global Information System Test, that would make selected nationally available data streams truly accessible to scientists worldwide, and complete indepth evaluations of the information content of the routinely available analyses and data products, including intercomparisons with in situ measurements and other satellite instruments. The experience gained in such a pilot program would be of inestimable value in the development of the much more ambitious plans for the data and information system associated with the Polar Platforms.

Demonstration projects for data access and evaluation should be carefully chosen for their probable utility to a broad group of international scientific users, and preferable in the context of established research projects expected to be then underway, such as Tropical Oceans Global Atmosphere Program (TOGA). They should be limited in scope but truly end-to-end tests of the conversion of data to useful information. They should draw upon developments in networking and electronic communications worldwide, starting in development mode but where appropriate building to near real time processing and distribution. Consideration should also be given to new techniques of digital publishing such as CD-ROM, and to providing proper attribution in scientific literature to creative contributions in the preparation and evaluation of data sets and derived information. It is important to establish patterns of interaction between the research community and data management and instrument professionals that develop the full potential of the entire ongoing observing system, both space and in situ.

The environment of the proposed GIST is shown in Figure 1 (see section V). A possible broad categorization of activities for the GIST itself would be:

- · Data collection and distribution:
- Assembly, quality control, and analysis; and
- Independent validation and calibration.

The specifics in each category would vary greatly between the different

Elements of the end-to-end system which can be tested include:

· Calibration (instrument physical input versus digital output, traceability of standards);

## Global Information System Test

For NASA, 1992 will be a critical period in the developand of the Earth Chemising System in the Beneford details for polar platforms. But in 1997 as the constraint of the polar are polar platforms. But in the 1997's as the constraint of an evolving international Earth system chaosing progress. The TOEXAF varieties and Upper Annuclators Research Santian (IAAS) should be ready the Benefor to a major con-Sandlan (1945) thouse he study to the same has a major con-relation to the study of corns dynamics and the cause layer. The European Space Agency Earth Rotouvers Sandlan (1985 -1) and possibly the Topicone (1985 -1) should be begin-ning to make major combustions to the study of the earth, and addition to the meconological, but and of corns systems in various countries which are already in place and expected to consider.

The benefits of that already planted activity is space would be greatly subarred if the hierarchical Egypt Year and the property of the proper

and with the Polar Pinkerms.

Demonstration projects for data success and ovalization should be emrittely chance for their probable unitie to a should be emrittely chance for their probable unitie to an extensive of embedding of the emission of embedding of their content of embedding of their content of embedding of their medicacy, such as Topical Ocean Ottobal association Proquest (TOCAS). They should be limited in soope but only red so-cond tout of the conversion of data to used information. They should draw upon development is successfully and electronic communications were weldered; natural in development made but when appropriate building to ever red some processing and delectronic Consideration included his being in the secondary proper anotherior in conduction of data secure and delectronic controlled proper anotherior in controlled in the proposition and evolutions of data secure and delectronic to the propagation and evolutions of datas secure and delectronic controlled proper anotherior in controlled in the controlled in the controlled properties and the controlled in the propagation and evolutions of datas secure and delectronic controlled properties of the controlled propert

The minimum of the proposed GSST is shown in Figure 1 free section V). A possible broad congorization of scrivitim for the GSST (seef) would be:

- · Data collection and distribution:
- Amonthly, quality control, and analysis; and
   Independent validation and calibration.

The specifies in each caregory would very greatly conces the different faci.

Elements of the end-to-end system which can be toraid include:

- Calibration (instrument physical input versus digital colput, translobily of standards);
   Validation (instrument input versus quentity to be
- analyzed);
   Reduction algorithm (including arcillary date)
- \* Focusions agreement (releasing the same) were converge;

   Sampling (upper and density)

   Quantity content and dessecreptance crising;

   Analysis algorithms and anticulation models;

   Independent neutroniments; and

   Documentation and accept to information,

Possible candidates from which a short list of demonstra-tion projects should be acknowled include:

- In the context of the TOGA program, Selds of surface wind, see level, an author temperature, surface salar radiation, claudioren, atmospheric water vapor, and indices of precipitation
- still need to be put in the compan of estimates of surface
- In the counse of the proposed IGBP Joint Global Ocean Flore Study, fields of ocean chlorophys.

in 1992 both MOS and LANDSAT-6 are expected to be flying intrameters to measure recease color, from which can be derived the distribution of othersphyll in the ser-fere layers. Knowledge of this distribution is a high pri-trity requirement for the proposed international studies of autient cycling in the explorie core and transfer through the thermocline beneath. Effective machanisms used to be catalificated for making the data severable to scientiss in a timely manner and evaluating the relationships

- Validation (instrument input versus quantity to be analyzed);
- Reduction algorithm (including ancillary data) coverage;
- Sampling (space and time);
- · Quantity control and data acceptance criteria;
- Analysis algorithms and assimilation models;
- · Independent measurements; and
- Documentation and access to information.

Possible candidates from which a short list of demonstration projects should be selected include:

 In the context of the TOGA program, fields of surface wind, sea level, sea surface temperature, surface solar radiation, cloudiness, atmospheric water vapor, and indices of precipitation

ERS-1 will feature a scatterometer and an altimeter for estimating surface wind stress and changes in sea level respectively, which should be compared with ongoing in situ surface wind and subsurface temperature measurements. TOPEX/Poseidon will feature more precise measurements of sea level. Improvements in cloud drift winds from geostationary satellites would also be very significant in this context. There have already been inter-comparisons of U.S. based techniques for satellite derived estimates of sea surface temperature, but much better documentation and validation is needed of their use in practice. The Along Track Scanning Radiometer (ATSR) aboard ERS-1 will provide a unique opportunity both to get better estimates of sea surface temperature and to validate the interpretations being placed on the ISCCP data on global cloudiness. Microwave radiometers aboard MOS and METEOSAT could provide the first synoptic global analyses of atmospheric water vapor, but only if we learn how to integrate this information effectively into assimilation models. Microwave and infrared indices of precipitation are currently being assembled under the World Precipitation Climatology Project, but still need to be put in the context of estimates of surface evaporation and atmospheric moisture.

• In the context of the proposed IGBP Joint Global Ocean Flux Study, fields of ocean chlorophyll.

In 1992 both MOS and LANDSAT-6 are expected to by flying instruments to measure ocean color, from which can be derived the distribution of chlorophyll in the surface layers. Knowledge of this distribution is a high priority requirement for the proposed international studies of nutrient cycling in the euphotic zone and transfer through the thermocline beneath. Effective mechanisms need to be established for making the data accessible to scientists in a timely manner and evaluating the relationships

Smithsonian National Air and Space Museum Archives

The mission of the Smithsonian is the increase and diffusion of knowledge - shaping the future by preserving our heritage, discovering new knowledge, and sharing our resources with the world. Founded in 1846, the Smithsonian is the world's largest museum and research complex, consisting of 19 museums and galleries, the National Zoological Park, and nine research facilities. Become an active part of our mission through the Transcription Center. Together, we are discovering secrets hidden deep inside our collections that illuminate our history and our world.
