tives of these concerns to go from one part of the metropolitan area to another part with hardly greater effort or expenditure of time than is now required for the great bulk of today's taxi rides in Manhattan. These officials will use both common carrier service and corporate helicopters.

The Korean incident gave the helicopter its first opportunity to prove its usefulness and versatility in large scale operations under actual campaign conditions. The performance of the helicopter vindicated its many advocates. The military forces rapidly revised their requirements to place helicopter development and procurement high on their priority lists. Millions of dollars have been spent on developmental contracts, expansion of production facilities and procurement. It is probably no exaggeration to say that the helicopter industry has gained from five to ten years as a result of military interest arising out of the Korean experience.

Growth of a Transport System Resembles a Chain Reaction

The study of transportation history reveals that the growth process of a new method of transport involves a chain reaction among economic and technological elements. The growth of its traffic depends upon service and price relative to those of competing carriers. The charges for the new service further depend on traffic volumes, the standards of its service and the costs of providing the service. The costs depend, in turn, upon traffic volumes, operating methods, capital cost of equipment and facilities (or at least the portion to be borne by the carrier), and the service standards adopted by the carrier. Service standards and the capital cost of equipment and facilities are functions of their design and engineering. If, as a result of all the concomitant and sequential variations in these economic and technological factors traffic volumes increase, the chain reaction proceeds upon another spiral.

One may penetrate the chain at any point. But the economical and technological ingredients are the same: design of equipment; operating methods; capital cost of equipment and facilities; the costs of producing the service, both direct and indirect; the standards of service; charges for the service; and the market areas that are responsive to the service. These elements change at differential rates and their aggregate impact upon the new form of transport and the transportation market will differ from the patterns established by pre-existing forms of transport.

The helicopter has only attained a level of development where it holds forth the promise of becoming an important transport vehicle. The chain reaction has started but its unfolding lies in the future. This chapter presents a picture of the probable processes of its growth during the next 20 years.

The mission of the Smithsonian is the increase and diffusion of knowledge - shaping the future by preserving our heritage, discovering new knowledge, and sharing our resources with the world. Founded in 1846, the Smithsonian is the world's largest museum and research complex, consisting of 19 museums and galleries, the National Zoological Park, and nine research facilities. Become an active part of our mission through the Transcription Center. Together, we are discovering secrets hidden deep inside our collections that illuminate our history and our world.
